

Landfall

Installing in Blender 5.2 · macOS and Windows · Landfall 3.41.2

Landfall is an add-on that brings Maya's way of working into Blender: navigation, marking menus, shortcuts, project handling and a set of modelling and texturing tools.

Updating means going through these four steps again. Skipping the uninstall is the most common reason an update appears to have no effect.

Before you start

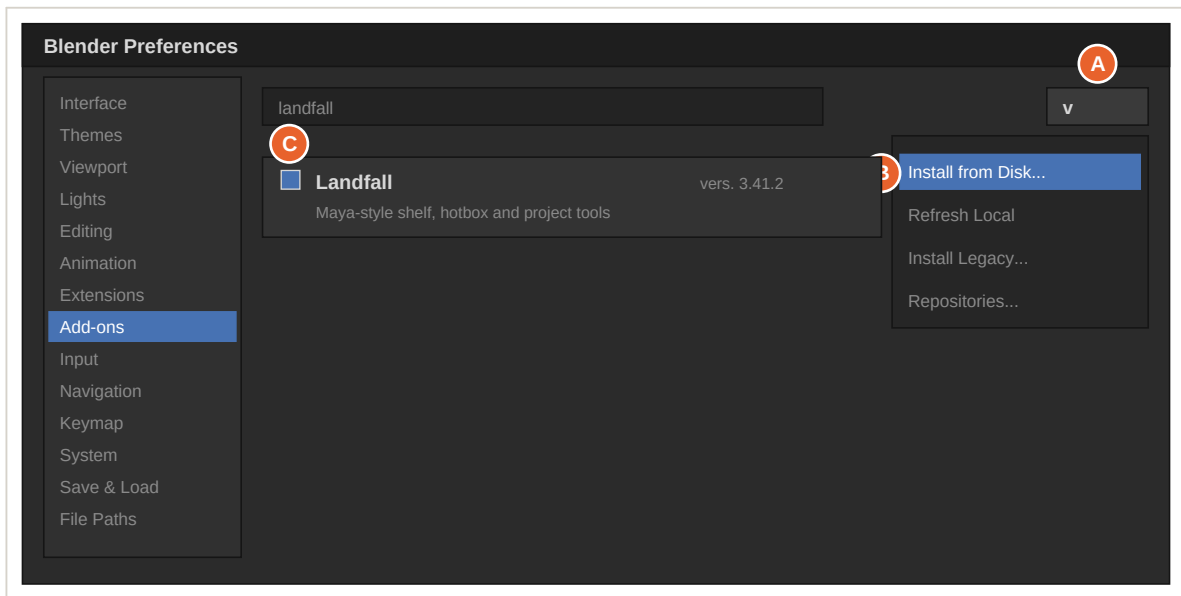

You need **Blender 5.2 or newer**. Check the version in the Blender menu, or at the bottom right of the status bar.

Download **landfall-x.x.x.zip** and **do not open it**: on macOS a double click unpacks it, and Blender needs the compressed file. If you end up with a folder instead of a file, compress it again or download it afresh.

If you are updating from an earlier version

Do not install on top. Uninstall the old version first, following **Uninstalling and starting over**, then install the new one. Installing over an existing copy is the most common reason an update appears to have no effect.

Installing from the zip file

A the button that opens the menu · B the Install from Disk entry · C Landfall in the list, ticked, with its version number on the right.

- 1 Open Blender and go to **Blender > Preferences** on macOS, or **Edit > Preferences** on Windows.
- 2 Pick the **Add-ons** tab in the left column.
- 3 At the top right click the **down arrow** next to the search field, and choose **Install from Disk...**
- 4 Select **landfall-x.x.x.zip** and confirm.
- 5 Landfall appears in the list, already ticked. If you cannot see it, type *landfall* in the search field.

Checking that it worked

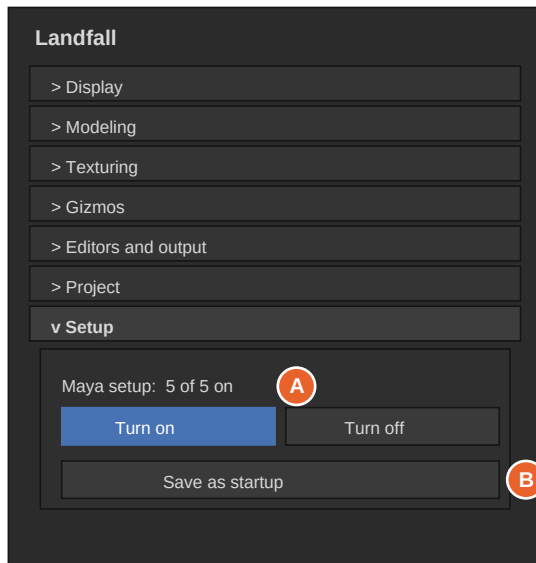

In the 3D viewport press **N** to open the sidebar and look for the **Landfall** tab. The version number is at the bottom of the panel: it must match the file you installed.

If the version number does not match

The install did not overwrite the previous one. Close Blender, delete the add-on folder shown further down by hand, reopen and install again.

First-time setup

Landfall arrives configured, but the interface colors have to be applied once, because they change Blender's theme.

Open the sidebar with **N**, pick the **Landfall** tab and open the **Setup** section at the bottom.

A The top line says how many of the five settings are on. Press **Turn on** to enable them all: navigation, marking menu, contextual wire on shaded, colors and grid.

B Press **Save as startup** to keep the layout and settings at every launch. Do it from an empty scene, since it saves the file's contents too.

Uninstalling and starting over

Useful when an update does not take, or to put Blender back the way it was.

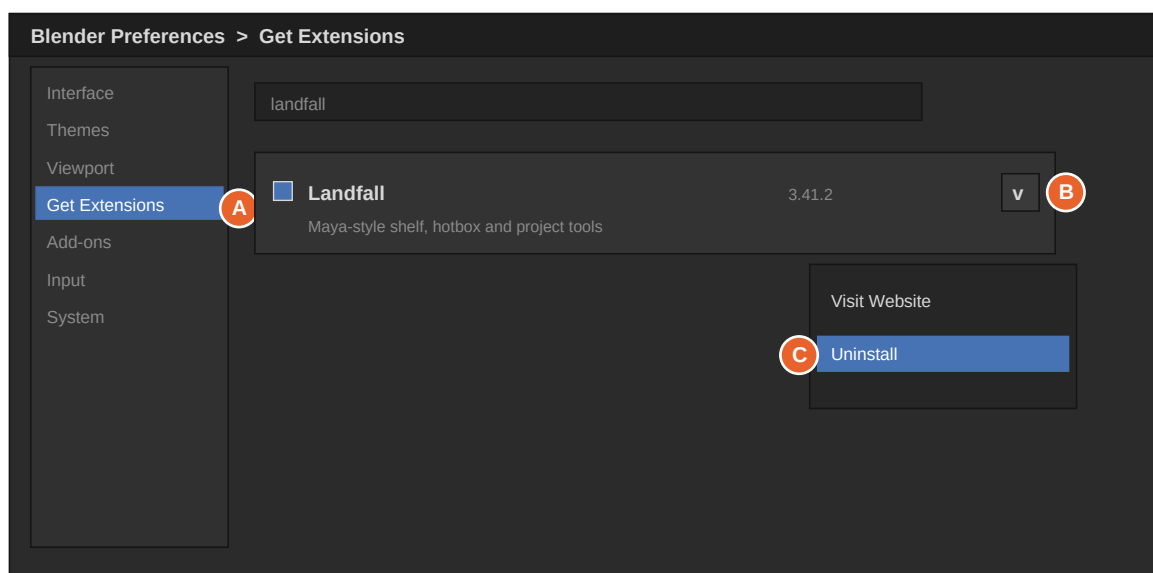

Before uninstalling: press Turn off

Two of the things Landfall changes cannot put themselves back once it is gone. The finite grid works by switching off Blender's own floor and axis lines and drawing its own in their place, so uninstalling leaves a viewport with **no grid at all** and nothing to restore it — and that state lives in the file, so restarting does not help. The Maya colors are a theme, and a theme stays where it is.

Turn off, in the panel's Setup section, restores both. If you have already uninstalled: re-enable Floor, X Axis and Y Axis in the viewport's Overlays menu, and use **Preferences > Themes > Reset to Default Theme** for the colors.

Careful: it is not in the Add-ons tab

Landfall is an extension, and for extensions the Uninstall command lives in **Get Extensions**. In the Add-ons tab, where you installed it, that command **does not exist**: it only appears for legacy add-ons. Looking there is wasted time.

A the Get Extensions tab, not Add-ons · B the small arrow at the right end of the row · C the Uninstall entry in the menu it opens.

- 1 Go to **Preferences > Get Extensions** and type *landfall* in the search field.
- 2 At the right end of the row click the **small arrow** and choose **Uninstall**.
- 3 **Close Blender**. This is the step people skip most often, and the one that matters.
- 4 Check that the add-on folder has really gone, and delete it by hand if it is still there.
- 5 Reopen Blender and install the new version.

Where the folder is

macOS ~/Library/Application Support/Blender/5.2/extensions/user_default/landfall

Windows %APPDATA%\Blender Foundation\Blender\5.2\extensions\user_default\landfall

On macOS the Library folder is hidden: in the Finder press **Cmd + Shift + G** and paste the path.

Why the folder must really be deleted

Inside it there is a subfolder called `__pycache__` holding the compiled code. If it stays, Blender can keep running the old version even after a successful install: the add-on looks updated while behaving exactly as before.

Extensions worth having alongside Landfall

Two official Blender extensions complement Landfall well, and install from **Preferences > Get Extensions** by searching for them by name.

Gizmo Resizer changes the size of the manipulator with **Numpad +** and **Numpad -**. Careful: on a laptop without a numeric keypad those keys do not exist and the command never fires. In that case reassign them in **Preferences > Keymap**, searching for `gizmo_resize`, and put them on `=` and `-` on the main row, which are Maya's keys.

Maya Pivot adds Maya-style pivot handling.

Common problems

Symptom	Cause and fix
The Landfall tab is missing from the sidebar	The add-on is installed but not enabled. In Preferences > Add-ons check that the box next to its name is ticked.
The version number is the old one	The install did not overwrite. Uninstall, close Blender, delete the folder, install again.
The panel disappears when I delete everything	You are looking at the wrong Properties tab. Landfall is in the Scene tab, the one with the cone and the sphere.
The shortcuts do not respond	The pointer has to be inside the 3D viewport. Keys do not reach the side panels.
The colors have not changed	Colors are applied by hand: Setup > Turn on, or the Maya colors button.
A shortcut stopped working, I or Tab for instance	A keymap has lost its entries. Restart Blender: Landfall rebuilds it at startup. Then press Self check in Setup to confirm.
I uninstalled and the viewport has no grid	The finite grid had switched off the native floor and axes. Re-enable them in the viewport's Overlays menu. To avoid it, press Turn off before uninstalling.
Self check says all passed but shows NOTE lines	NOTE lines are not errors: they point out a Landfall shortcut that covers one of Blender's own. With Blender 5.2 there are none; if one appears after you update Blender, the new version uses a key Landfall had already taken. Real problems are the FAIL lines.
I cannot find Uninstall in Add-ons	It is not there: it is in Get Extensions. See the uninstall section.
